AB This document discloses a process for producing 2-hydroxy-4-methylthiobutanoic acid which comprises hydrating 2-hydroxy-4-methylthiobutanenitrile in the presence of sulfuric acid, **hydrolyzing** the 2-hydroxy-4-methylthiobutanamide contained in the reaction mixture, subsequently separating the resultant reaction mixture into an oil layer containing 2-hydroxy-4-methylthiobutanoic acid and an aqueous layer, and circulating a part of the aqueous layer to the **hydrolysis** step and/or the oil/water separation step. By the process, 2-hydroxy-4-methylthiobutanoic acid can be efficiently obtained in a satisfactory manner without using an organic solvent.

 AB The preparation of 2-hydroxy-4-(methylthio)butyric acid esters [e.g., iso-Pr 2-hydroxy-4-(methylthio)butyrate] comprises: (a) a first step of reacting 2-hydroxy-4-(methylthio)butyronitrile with sulfuric acid to produce 2-hydroxy-4-(methylthio)butyramide; and (b) a second step of reacting the 2-hydroxy-4-methylthiobutyramide with an alc. (e.g., isopropanol) to

produce a 2-hydroxy-4-methylthiobutyric acid ester, the two steps being carried out in the same reaction medium.

(no data), is prepared in high yield and selectivity by the two-step
sulfuric acid **hydrolysis** of 2-hydroxy-4-
(methylthio)butyronitrile (I) using a 0.6-0.88 M quantity of the sulfuric
acid relative to I and in the presence of 1-3 mol of water per mol of I at
≤60° to form 2-hydroxy-4-(methylthio)butyramide which is
then subjected to a second **hydrolysis** with sulfuric acid in the
presence of a supplementary quantity of water.

OTHER SOURCE(S): CASREACT 130:83195

AB A continuous process for the preparation of 2-hydroxy-4-methylthiobutanoic acid (I), or its salts, comprises introducing an aqueous mineral acid (e.g., aqueous sulfuric acid) into a nitrile **hydrolysis** reactor (i.e., a continuous stirred tank reactor) and introducing 2-hydroxy-4-methylthiobutanenitrile into the reactor to produce a continuous **hydrolysis** product stream containing 2-hydroxy-4-methylthiobutanamide. The reactor **hydrolysis** product stream is continuously introduced into an amide **hydrolysis** flow reactor and continually **hydrolyzed** to an aqueous I-containing **hydrolyzate**.

AB The process includes introducing an aqueous mineral acid (especially concentrated H₂SO₄) into a nitrile **hydrolysis** reactor including a continuously stirred tank reactor and introducing 2-hydroxy-4-methylthiobutanenitrile into the nitrile **hydrolysis** reactor. 2-Hydroxy-4-methylthiobutanenitrile is continually **hydrolyzed** to produce a product stream containing 2-hydroxy-4-methylthiobutanamide which is subsequently **hydrolyzed** within the amide **hydrolysis** flow reactor to produce 2-hydroxy-4-methylthiobutanoic acid which is then recovered from the aqueous **hydrolyzate** product.

AB MeSCH₂CH₂CH(OH)CN (I) is **hydrolyzed** with 50-70 weight % H₂SO₄ to give MeSCH₂CH₂CH(OH)CONH₂, which is further **hydrolyzed** with 30-50% H₂SO₄ to give MeSCH₂CH₂CH(OH)CO₂H (II). II is recovered by liquid-liquid extraction. Thus, I was treated with 50% H₂SO₄ at 50° for 1 h, followed by heating at 90° for 100 min, neutralization with NH₃, and extraction of II with MeCOPr. II had lighter color, less odor, lower viscosity and better thermal stability, compared to II prepared by standard methods. II is a feed supplement.
